BE HIS HERO.

SCHEDULE YOUR COLONOSCOPY TODAY.

About 1 in 20 Americans will be diagnosed with colorectal cancer. You can beat those odds. A colonoscopy provides your greatest defense against colon cancer by catching it early, when it is most treatable.

The experienced digestive health experts at MD Anderson Cancer Center at Cooper provide outstanding care at our conveniently located state-of-the-art facilities. Screenings are covered by most health insurance plans.

Colonoscopy screenings are available at our Digestive Health Institute locations:
Camden | Mount Laurel | Willingboro

Making Cancer History®

Convenient Primary Care for the Entire Family

Having a primary care provider is essential to a healthy lifestyle. As part of the region's leading academic health system, Cooper's expert primary care physicians and advanced practice providers offer a wide array of health care services for patients of all ages.

With offices in more than 30 convenient locations throughout South Jersey, Cooper is your hometown health team. Most of our locations offer same-day or next-day appointments and early morning or evening hours. We make it easy for you and your loved ones to stay healthy.

You can trust Cooper primary care physicians and advanced practice providers for annual checkups, preventive health screenings, unscheduled "sick" visits, medication management, vaccines, and more.

Our team works with you to manage a wide range of chronic conditions, including high blood pressure, diabetes, high cholesterol, asthma, COPD, and arthritis. If needed, our providers can refer you to one of our expert specialists, help to coordinate your care, and help you to understand your treatment options.

If you've been looking for a great doctor or advanced practice provider, now is the perfect time to schedule an appointment with a Cooper primary care provider at a convenient location close to you.

For more information or to request an appointment online, visit CooperHealth.org/PrimaryCare.

HeroCare Connect™ Streamlines Access and Care for Veterans, Active Duty Military, and Families

Since 2017, Cooper University Health Care and Deborah Heart and Lung Center have partnered to bring convenient and expedited access to quality specialty health care to local veterans, active duty military, and their families through HeroCare Connect. HeroCare Connect services include more than 75 medical specialties available in more than 100 convenient locations in Burlington, Camden, Mercer, Gloucester, and Atlantic counties.

The program provides a medical link for active duty military stationed at Joint Base McGuire-Dix-Lakehurst to supplement the primary, gynecologic, and pediatric care currently available on base. When active duty military and their family members need specialty care, HeroCare Connect acts as a concierge scheduling and navigation service to help them to access the services they need.

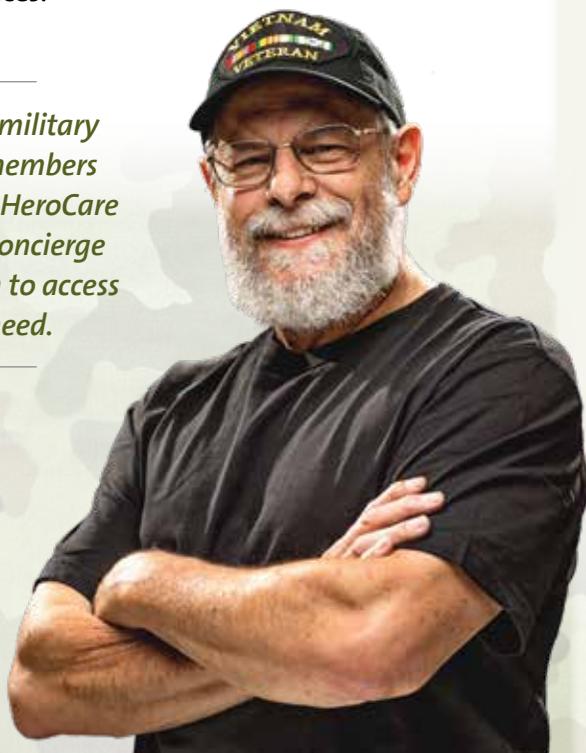

The HeroCare Connect Patient Service Service Center has specially trained staff to navigate care, including scheduling appointments, following up with results and reports, coordinating additional testing, and communicating with medical and military professionals who are involved with each patient's care.

4

“If you know a hero, tell a hero.”

HeroCare Connect wants you to help spread the word about the program and let other veterans, active duty military, and their families know how easy it is to access these services.

When active duty military and their family members need specialty care, HeroCare Connect acts as a concierge service to help them to access the care they need.

Veterans covered by the Veterans Choice Program can take advantage of this personalized concierge program when their primary care physician on base or at the VA recommends testing or a visit with a specialist. Once a referral is obtained, patients can call HeroCare Connect, who will take it from there—securing a convenient priority appointment, verifying insurance, obtaining and transferring all relevant medical records, and arrange transportation if needed, and more.

A HEART MILESTONE

Cooper Performs 1,000th TAVR Procedure

Joseph Borgese, the 1,000th TAVR patient at Cooper, with his Cardiac Partners at Cooper and Inspira heart team, from left to right, Simon K. Topalian, MD, FACC, Interventional Cardiologist; Amy Petrini, BSN, RN, PCCN, Cardiology Clinical Director; Jeremy Witcher, RN; and Tara Jones, RN, BSN, Structural Heart Nurse Navigator.

The multidisciplinary team from the Cardiac Partners at Cooper and Inspira Structural Heart Disease Program performed the 1,000th TAVR (transcatheter aortic valve replacement) procedure earlier this year. The patient was Joseph Borgese, 71, of Mantua.

“This represents a major milestone and the culmination of many years of training and experience for the Structural Heart Program and team since the TAVR program started in 2012,” said Philip A. Koren, MD, FACC, FSCAI, Medical Director of the Cooper Heart Institute, part of Cardiac Partners at Cooper and Inspira. “Cooper continues to have one of the most innovative and experienced TAVR teams in the region.”

TAVR is a minimally invasive procedure that allows for the replacement of an aortic valve that is damaged as a result of aortic stenosis. The patient receives a

new valve without the need for open heart surgery. During the TAVR procedure, a catheter is used to feed an artificial valve through an artery in the groin or the chest to the heart. Once placed in the correct position, the artificial valve is opened, and it begins to function immediately.

The multidisciplinary team, which includes cardiologists, anesthesiologists,

radiologists, nurses, and technicians work together to assess patients and perform the TAVR procedure. They use a state-of-the-art hybrid operating room that offers the advanced imaging technology and facilities that are needed for this delicate implant procedure. Cooper has performed more TAVR procedures than any other hospital in southern New Jersey.

Meet Our New Cardiac Partners at Cooper and Inspira Team Member

Mario Caruso, DO, a Clinical Cardiologist, joins Cooper from the Lehigh Valley Health Network in Allentown, PA, where he completed his fellowship in cardiovascular disease. Dr. Caruso has a special interest in sports cardiology, providing cardiac evaluation, risk assessment, and guidance for return to sports for adult athletes at all levels, most recently with athletes diagnosed with COVID-19. Dr. Caruso is accepting new patient appointments in our Voorhees and Turnersville offices.

New Recommendations for Colorectal Cancer Screening

45 IS THE **NEW** **50**

Colorectal cancer, although one of the most curable types of cancer when caught at an early stage, remains the second leading cause of cancer deaths in the United States.

Working together, the experts at the Cooper Digestive Health Institute and MD Anderson Cancer Center at Cooper offer advanced colorectal cancer screening and diagnosis and give new hope to patients with colorectal cancer.

“The majority of colorectal cancers are found in people over 65, but in the over-50 population, incidence rates have actually been declining,” says Adam B. Elfant, MD, Head, Division of Gastroenterology at Cooper Digestive Health Institute. “These positive changes are likely due to an increase in colon cancer screenings in this age group. Screenings give us the ability to catch cancer early and even prevent cancer.”

Unfortunately, cases have been rising in people younger than 50, prompting organizations such as the American Cancer Society and the U.S. Preventive Services Task Force to recommend colorectal cancer screenings to start at age 45. “These new screening recommendations are well supported,” says Dr. Elfant. Screenings can be done with tests taken at home with stool samples (FIT test or Cologuard) or with imaging-based tests performed by physicians, such as colonoscopy.

6

“The advantage of a colonoscopy, which is considered the ‘gold standard’ for screening, is that it provides definitive results, and if polyps are found, we can remove them during the procedure—actually preventing cancer,” says Dr. Elfant. “But the best screening test is the one that gets done.”

Advanced Treatment for Colorectal Cancer

If you or someone you love has been diagnosed with colorectal cancer or another GI cancer, one of the most important decisions you will need to make is where to go for care. At MD Anderson at Cooper, our collaborative, team approach to cancer care improves the patient’s experience and promotes better outcomes.

“Most patients are seen by a medical oncologist, a surgeon, and a radiation oncologist when appropriate. Each patient’s case is reviewed with a group of experts from different cancer specialties during our weekly tumor board,” says Steven J. McClane, MD, FACS, FASCRS, Head of Colorectal Surgery at MD Anderson at Cooper. “During these collaborative meetings, the team develops a personalized treatment plan for each patient. The plan may include surgery, medical treatments such as chemotherapy or immunotherapy, radiation, and other cutting-edge options.”

Surgery

“Surgery is a common treatment for many GI cancers, including colorectal cancer. In some cases, it can be used alone, but more often, it is combined with radiation and/or medical therapy,” says Danica N. Giugliano, MD, Colorectal Surgeon at MD Anderson at Cooper. “We attempt to use the most minimally invasive procedure possible for each patient. Minimally invasive procedures offer patients a small incision size, which affects how the patient will do in their immediate recovery and in their return to normal activity and function,” says Dr. Giugliano.

Advanced Medical Treatment

“Depending on the type of GI cancer and the needs of the patient, our GI cancer team sometimes uses medical treatments to shrink the cancer before surgery,” says Kinjal Dargan, MD, Medical Oncologist and GI Cancer Specialist at MD Anderson at Cooper. This approach can make surgery an option for patients with otherwise inoperable tumors.

Gastrointestinal Cancer

Gastrointestinal (GI) cancer is a term used for the group of cancers that affect the GI tract and other organs within the digestive system, including:

- Esophagus
- Stomach
- Liver
- Pancreas
- Bile duct and gallbladder cancer
- Colon
- Small intestine
- Rectum
- Anus
- Rare GI cancers

With programs and specialists for every type of GI cancer, convenient locations throughout South Jersey, access to advanced treatment options—including groundbreaking clinical trials—and a full range of supportive care services, MD Anderson at Cooper is the region’s top choice for cancer care.

Head, Colorectal Surgery

David J. Mulvihill, MD

Radiation Oncologist

It can also make the procedure safer and more effective. After surgery, medical treatments can be used to treat cancer that has spread to the lymph nodes or to relieve symptoms of GI cancer that has spread to other areas of the body.

“In addition to chemotherapy, our team may use targeted drug therapies,” says Dr. Dargan. “Targeted therapies attack the specific gene, proteins, or the tissue environment that aids cancer growth and survival. This type of treatment blocks the growth and spread of cancer cells while limiting damage to healthy cells.”

Powerful, Precise Radiation Treatment

“In addition to offering patients advanced surgical and medical treatment options, we have been able to become more precise with radiation therapy,” says David J. Mulvihill, MD, Radiation Oncologist, MD Anderson at Cooper.

An exciting new option is the MR-Linac device, an innovative radiation technology that combines a powerful magnetic resonance imaging machine and a linear accelerator into a single device. MD Anderson at Cooper is one of only five cancer centers in the U.S. to offer patients this radiation treatment option.

“The technology allows us to deliver pinpoint radiation that we can adjust as the tumor responds, or as things shift in the body during the treatment process. With the MR-Linac device, we can minimize side effects and reduce the number of treatments for our patients,” says Dr. Mulvihill.

Supportive Care Services

MD Anderson at Cooper supports patients throughout their cancer journey by providing a full range of supportive care services, including genetic counseling and testing, social work services, nutritional counseling, integrative oncology, and complementary medicine therapies, to help patients to manage the many physical, emotional, and social challenges that can accompany their diagnosis and treatment.

The support we provide starts with our nurse navigators, who guide patients through the entire process.

Close to Home

Patients who have colorectal and other GI cancers require frequent visits for evaluation and treatment. With three comprehensive care centers and multiple offices located throughout South Jersey, you’ll find that our cancer experts are always close to home:

- Voorhees
- Camden
- Willingboro
- Cherry Hill
- Mount Laurel
- Sewell
- Egg Harbor Township

To schedule your colonoscopy with a Cooper Digestive Health specialist, call **856.642.2133**. For more information, or to schedule an appointment with a gastrointestinal cancer expert, call **855.MDA.COOPER (855.632.2667)**.

MD Anderson at Cooper’s Rectal Cancer program has been certified by the National Accreditation Program for Rectal Cancer.

- This certification is granted only to those programs that have demonstrated commitment to providing the best possible care with NAPRC Standards for quality, outcomes, and multidisciplinary care.
- MD Anderson at Cooper is one of only 26 programs in the U.S. to receive this honor.

The Ripa Center Keeps You Healthy for Life

The Ripa Center for Women's Health and Wellness at Cooper provides women with comprehensive, high-quality health care throughout their lives. Regenerative Medicine and Orthobiologics Program

The future of orthopaedics is at Cooper.

The sports medicine experts at Cooper University Health Care, the region's leading academic health system, have a new way to get you back into the game. Patients now have access to proven and evidence-based regenerative medicine and orthobiologic techniques to stimulate the body's own ability to rebuild and heal injured muscles, tendons, ligaments, bone, and cartilage.

"Regenerative medicine is the practice of repairing, or 'regenerating,' human cells, tissues, or organs to restore function after an injury, wear and tear due to age, or damage caused by a chronic condition," says Cody B. Clinton, DO, Co-Director, Regenerative Medicine and Orthobiologics Program at Cooper. "Our goal is to use these novel orthobiologic treatments to stimulate the body's own innate healing properties and eliminate pain."

Orthobiologic treatment is a specific type of regenerative medicine. This technique uses individualized biomaterial and cell-based therapies to engage the body in repairing its own bone and cartilage.

Orthobiologic therapies limit or eliminate the need for a hospital stay and help to accelerate the healing process. These treatments can improve a person's chances for regaining function and greatly reduce the risk for osteoarthritis later in life.

Regenerative medicine and orthobiologic treatments are often a second-line option for people who have not had success with more conservative therapies, such as medication or physical therapy. These treatments offer relief from conditions such as osteoarthritis, muscle and tendon injuries, ligament and meniscal injuries, bone and cartilage defects, and sports injuries.

Some of the nonsurgical options include platelet-rich plasma (PRP), stem cell, hyaluronic acid, and prolotherapy injections.

PRP injection therapy has been a part of Cooper's sports medicine practice for years. Platelets are specialized cells that circulate through the blood to promote healing and decrease pain. Instead of blocking inflammation and impairing healing, as most steroids and

Cody B. Clinton, DO
Co-Director, Regenerative Medicine
and Orthobiologics Program

anti-inflammatories do, the goal of PRP therapy is to restart the healing process.

"To perform this therapy, we take a sample of our patient's own tissue and create a concentrated solution that is then injected back into them," says Dr. Clinton. "These injected cells 'call' other cells together to the site of injury to make proteins and molecules that can alleviate inflammation and reduce pain symptoms."

PRP injections require only one office visit. Certified phlebotomists take a sample of the patient's blood in our laboratory. A centrifuge is used to separate the blood into many components. The concentrated platelets are then injected into the injured tissue with ultrasound guidance. After only

one injection, many patients can return to normal activity within a few weeks.

"We have attended many national conferences and participated in discussions among peers to ensure that these new treatment options were brought to Cooper safely," continues Dr. Clinton. "Our techniques target only the damaged tissue, without harming the surrounding areas."

We work with our patients to develop a personalized treatment plan that ensures great results and gets them back to the activities they love as quickly and safely as possible."

Our Regenerative Medicine and Orthobiologics Program experts have offices conveniently located in Voorhees, Cherry Hill, Glassboro, Camden, and Willingboro, NJ. To make an appointment, please call **800.8.COOPER (800.826.6737)**.

Radiology Services for the Entire Family

Cooper Specialty Center at Cherry Hill
2339 West Route 70 • Cherry Hill, NJ 08034

The Diabetes Weigh

Managing diabetes takes time, attention, perseverance, and skill. We develop an individualized program that's right for you.

Start dates · 5 weekly sessions:

10 a.m. – 11:30 a.m.

- October 10, 2021
- January 11, 2022

2 p.m. – 3:30 p.m.

- September 16, 2021
- October 6, 2021
- January 13, 2022

6 p.m. – 7:30 p.m.

- September 13, 2021
- October 25, 2021
- January 10, 2022

One-day session:

9 a.m. – 3 p.m.

- September 21, 2021
- October 12, 2021
- January 12, 2022

What Is Continuous Glucose Monitoring (CGM)?

Everyone's talking about CGM. Learn what it is, what systems are available, how they differ, and whether it is right for you. Bring your questions!

1 p.m. – 2 p.m.

- September 8, 2021
- November 11, 2021
- January 26, 2022

Using Continuous Glucose Monitoring (CGM) for Change

Two-class series:

CGM is an exciting diabetes technology that can help you to learn more about your body, your food, activity, and what happens to your glucose throughout the day and overnight.

Class 1: We will discuss personal systems and place a sensor that you will wear for two weeks.

Class 2: You will learn to interpret the information gathered while wearing the sensor.

Sessions:

1 p.m. – 2 p.m.

- September 29 and October 29, 2021
- January 14 and February 4, 2022

THE ABOVE PROGRAMS ARE COVERED BY MOST INSURANCE PLANS.

Regional Cleft Palate—Craniofacial Program

- 24-hour newborn outreach and assessment available to birthing hospitals for infants with cleft and craniofacial conditions, including assistance with feeding issues.
- For information and referral, call **856.722.9110**.
- Parent-to-parent support.

Safe Kids Free Car Seat Safety In-Person or Virtual Checkups

Child safety seat technicians will check your child's car seat for proper installation, factory recalls, defects, and proper seat selection, based on your child's age, weight, and height.

In-Person Car Seat Checkups:
